| Score (4 pts) | Lectures | 1-2 | Name |

1. Write the name of the principal functional groups in the following molecules. Spelling counts!

2. Draw an example of the molecule described. Structure should be in bond-line notation (i.e., do not write carbons and hydrogens explicitly).

| Aldehyde with only 3 carbon <br> atoms | Amide with the molecular <br> formula $\mathrm{C}_{4} \mathrm{H}_{9} \mathrm{NO}$. | Secondary alcohol with only <br> 5 carbon atoms. | Phenol with a methyl group <br> at the meta position. |

|  |  |  |  |

3. First, Rank in order of increasing boling point (1 = lowest boiling point; 4 = highest boiling point). Second, circle the compound that is likely the most polar.

$\qquad$
4. Determine the oxidation number for each carbon indicated.

5. Why might the first reaction above be considered an oxidation or a reduction?
6. The Dess-Martin periodinane oxidation is another common mild method for oxidizing primary alcohols to carbonyls. Draw a mechanism for the reaction below. Hint: Acetate groups $\left(-\mathrm{OAc} ;-\mathrm{OCOCH}_{3}\right)$ are good leaving groups and the first step is substitution of an acetate group by the alcohol.

7. First, rank the compounds in order of increasing C-O bond length ( $1=$ shortest; $3=$ longest). Second, explain your ranking. Discuss hybridization and draw resonance structures to support your conclusions.

$\qquad$
8. Sodium bicarbonate $\left(\mathrm{NaHCO}_{3}\right)$ is the conjugate base of carbonic acid $\left(\mathrm{H}_{2} \mathrm{CO}_{3}, \mathrm{pKa}=6.37\right)$. First, draw the products of the reaction of sodium bicarbonate with phenol and acetic acid. Second, use your book to determine the pKa values of a phenol and a carboxylic acid. Third, calculate the Keq for each acid-base reaction and determine which of these substances will react significantly (i.e., $\mathrm{K}_{\text {eq }}>1$ ) with sodium bicarbonate. Show your work.

$+\mathrm{NaCHO}_{3} \rightleftharpoons$

2-methylphenol a phenol

$+\mathrm{NaCHO}_{3}$
acetic acid
a carboxylic acid
9. Provide IUPAC names for the following structures.

10. When (R)-(+)-2-phenyl-2-butanol is allowed to stand in methanol containing a few drops of sulfuric acid racemic 2-methoxy-2phenylbutane is formed. Draw a reasonable mechanism then explain.
11. Unlike aldehydes and ketones, esters cannot be reduced by $\mathrm{NaBH}_{4}$, but are readily reduced by $\mathrm{LiAlH}_{4}$. Explain this observation. Your reasoning should include a discussion of the ground state energies of $\mathrm{NaBH}_{4} \mathrm{vs}$. $\mathrm{LiAlH}_{4}$ and for ketones vs. esters. Draw resonance structures where appropriate to support your logic.
12. Rank the following phenols in order of increasing acidity ( $1=$ least acidic, highest $\mathrm{pKa} ; 4=$ most acidic, lowest pKa ).

13. Draw the conjugate base for the two left-most structure in the problem above. Include all lone-pairs and charges. Next, draw all possible resonance structure for each conjugate base that shows delocalization of the negative charge on oxygen.
$\qquad$
14. Draw the major organic product for each reaction. Include stereochemistry where it is relevant.

$\qquad$
15. Devise a synthesis for each of the following. Show the major product after each step in your synthesis.
